This forum discusses the urgency of a just energy transition, analyzing the fossil fuels' phase-out from a situated perspective. Taking the Amazon and the Arctic as iconic regions of transformation, the dialogue transcends the local to explore "Yasunization" as a global phenomenon of social mobilization generated by a multitude of grassroots initiatives. The role of geovisualization tools in mapping the multitudes and narratives driving this change is explored. Through a panel of researchers and activists, the tensions between extractive policies and community-based alternatives will be discussed, highlighting how visual data can strengthen political advocacy and environmental justice in diverse territories that are shaping these transitions. The forum contributes to the feedback process for the "Atlas of a Just Transition from Fossil Fuels" and the "Dictionary of Climate Justice Practices for the Fossil Fuel Transition."
